

Save energy reduce glare using sensor-dimming retrofit

Do your LED panels stay on when daylight is enough, or when nobody is nearby?
Are some of your LED panels brighter than your staff need (or want) them to be?

This wastes a lot of unnecessary energy.

We've added motion-and-daylight sensor/dimming to thousands of LED panels.

Simple hand-held remote control allows you to change things like what time lights stay on for, how bright they are, how they respond to daylight

These lights are all set to an energy-saving light-level compared to standard LED panels (less glare)

We will need to see photos of your LED panels taken from above,
or visit your building to ensure we can fit a compatible-upgrade.
